

Jeff Tester
Comments on IPCC Geothermal Paper
(via e-mail; received [from Roy Baria]: 6 June 2008)

I agree fully with John's [John Garnish] comments. You should urge the IPCC to include in their report a clear and succinct description of the pathways to technology improvement that would enable EGS to play the role that it is capable of.

As a **very large, accessible**, baseload, dispatchable source of power and heat, EGS will certainly be easier to scale globally (technically, economically, and politically) over most if not all other carbon free options (from nuclear fission to clean coal to all other renewables).
